AI Recruiter

Hiring workflows with human review

From approved headcount to candidate handover.
AI prepares the evidence. People own the decisions.

NeuroMakers / Vultr Agent Rush / November 2026

Recruitment is a coordination problem

The handoffs are the hard part

A hiring request passes through managers, approvers, recruiters and candidates. Context is easy to lose between tools.

One application keeps the history

AI Recruiter links approved headcount, position requirements, candidate evidence, interviews and handover.

Human decisions stay explicit

AI prepares drafts and evidence. Authorized people review, approve and move the process forward.

A complete workflow on Vultr

Plan and approve

Submit a hiring request, check headcount and approvals, then generate and publish a position.

Match and coordinate

Review consented candidate evidence, compare requirements, manage conversations and schedule interviews.

Decide and hand over

Collect feedback, route hiring approvals, hand over the record and track the final outcome.

Seven AI components, one accountable backend

Dify + DeepSeek

A1 job descriptions; A2 talent matching; A3 resume extraction; A4 reply drafts; A5 evidence assessment; A6 interview notes; A7 insights.

FastAPI controls execution

Permissions, workflow state, version checks, idempotency and audit records stay in the application backend.

Evidence before action

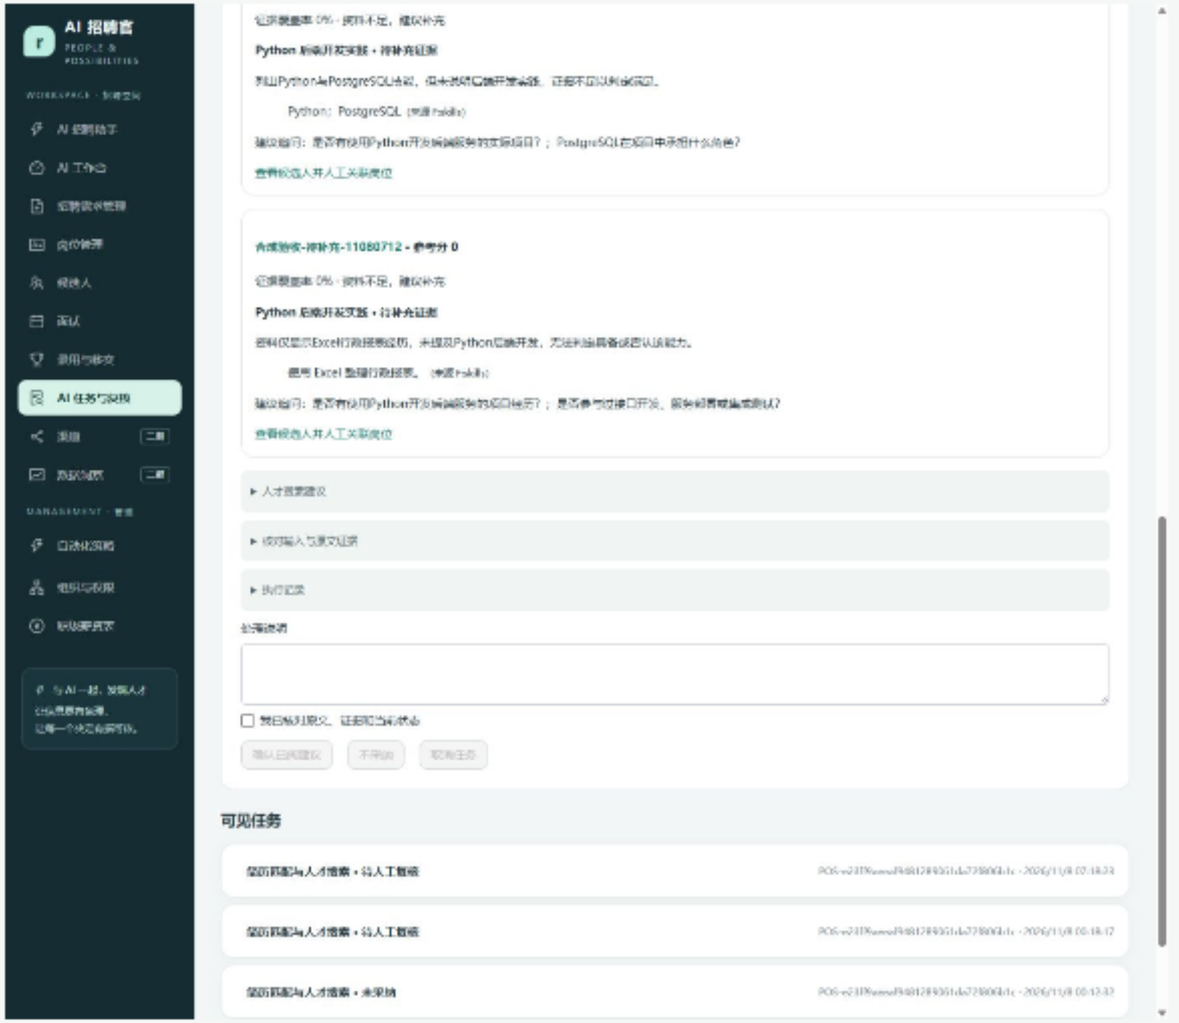

Missing evidence stays unknown. Recruiters inspect source excerpts before acting on model suggestions.

A matching result you can inspect

Observed in the deployed app

Synthetic Python role
Three consented profiles
Source excerpts and follow-up questions
Human review before action

Missing evidence is not a rejection.
The reference score is not a hiring decision.

Vultr runs the operational system

01 **Browsers**

HR web · manager H5 · candidate H5

02 **Vultr VM / Singapore**

HTTPS proxy · React · FastAPI

03 **Persistence + AI orchestration**

PostgreSQL · Redis · self-hosted Dify

04 **Model service**

DeepSeek API outside the VM

A working prototype with clear limits

Demonstrated

Live HTTPS deployment
Approved request linked to a position
Natural-language progress query
AI matching with source evidence
Explicit human review controls

Next milestones

Configure external messaging and calendars
Resolve newer assistant review findings
Complete AI interview workflows
Validate quality and production scale

No claim of measured hiring ROI, automated hiring decisions or production-scale validation.
